

HACKMYSURU 1.0 — DECISION LOG

Team ID: HM26-7523 | Project: Mysuru Civic Router

Decision	What We Decided	Reason
Problem Focus	Focus on civic complaint routing based on location and issue type.	Addresses the challenge of identifying the correct responsible authority.
Core Approach	Use geospatial boundaries to determine the most likely responsible authority.	Reduces manual guessing and complaint misrouting.
Citizen Input	Collect complaint description, issue category and location/GPS.	Provides the information needed for routing.
Map	Use an interactive map to display complaint locations and administrative boundaries.	Makes location and responsibility easier to understand visually.
Routing Logic	Check coordinates against administrative boundaries, then combine boundary and issue information.	Creates a clear, explainable routing process.
Complaint Tracking	Show complaint status from submission through resolution.	Improves transparency for citizens and authorities.
Technology	React + TypeScript, MapLibre GL JS, Node.js/Express, PostgreSQL/PostGIS, GeoJSON/Turf.js.	Supports web development and geospatial processing.
Prototype Goal	Demonstrate an end-to-end flow: Report → Locate → Analyze → Route → Track.	Keeps the hackathon prototype focused and demonstrable.

Team Members: Tejas M • Jeevan Nag N • Yashas M • Nikhil M

Final Decision: Build a location-aware civic complaint router that helps connect each reported issue with the most likely responsible authority and provides complaint tracking.
